Mobile app design

Prototype – Part 2/2

Stefano Burigat

Dipartimento di Scienze Matematiche, Informatiche e
Fisiche - Università di Udine

stefano.burigat@uniud.it

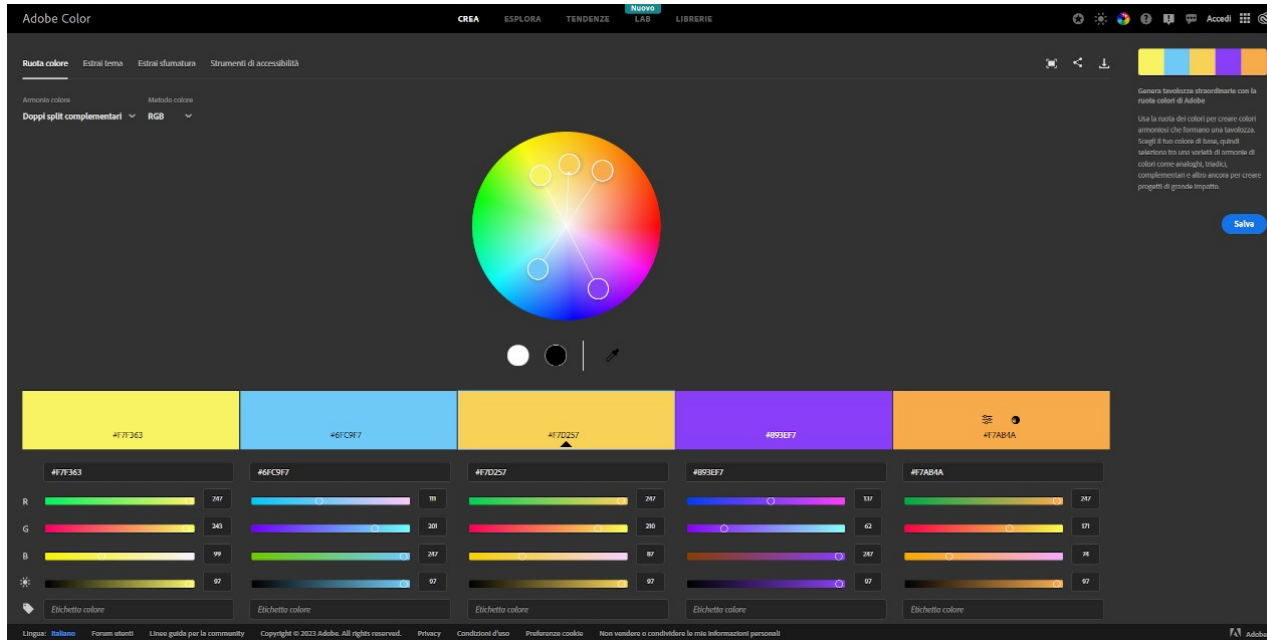

Hi-fi prototypes

- Once you have found an appropriate design with low-fi prototyping, it is possible to create **hi-fidelity prototypes** to focus on
 - the details of graphic design
 - interactivity
- Technically, we can distinguish:
 - **mockups**: static screens that include visual elements such as typography, colors, custom iconography, logos, images
 - **interactive prototypes**: digital prototypes that allow users to interact with the elements of the application

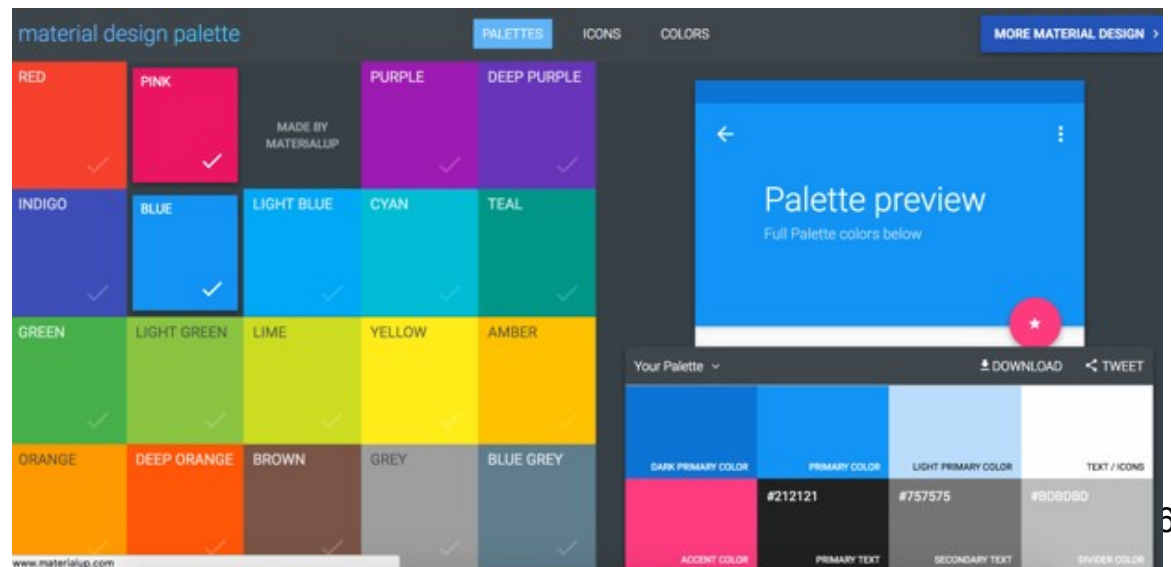

- You can create mockups with graphic packages such as Photoshop
- You can quickly create interactive prototypes with rapid prototyping tools such as Figma, Miro, Marvel or by using programming languages
- From the point of view of graphic design, creating hi-fi prototypes is easier when your organization has a predefined custom style guide

- Use common graphical and typographical rules from other domains (publishing, web, hci, etc.)
 - Be consistent in the design of your screens
 - Do not use too many different fonts and font sizes (max 1-2)
 - Do not use too many colors (max 2-3 + neutrals)
 - Choose appropriate color palettes
 - Remember that colors are associated to emotions (and that they are culturally-dependent)
 - Use style tiles / mood boards to explore different visual styles

Renee Lin

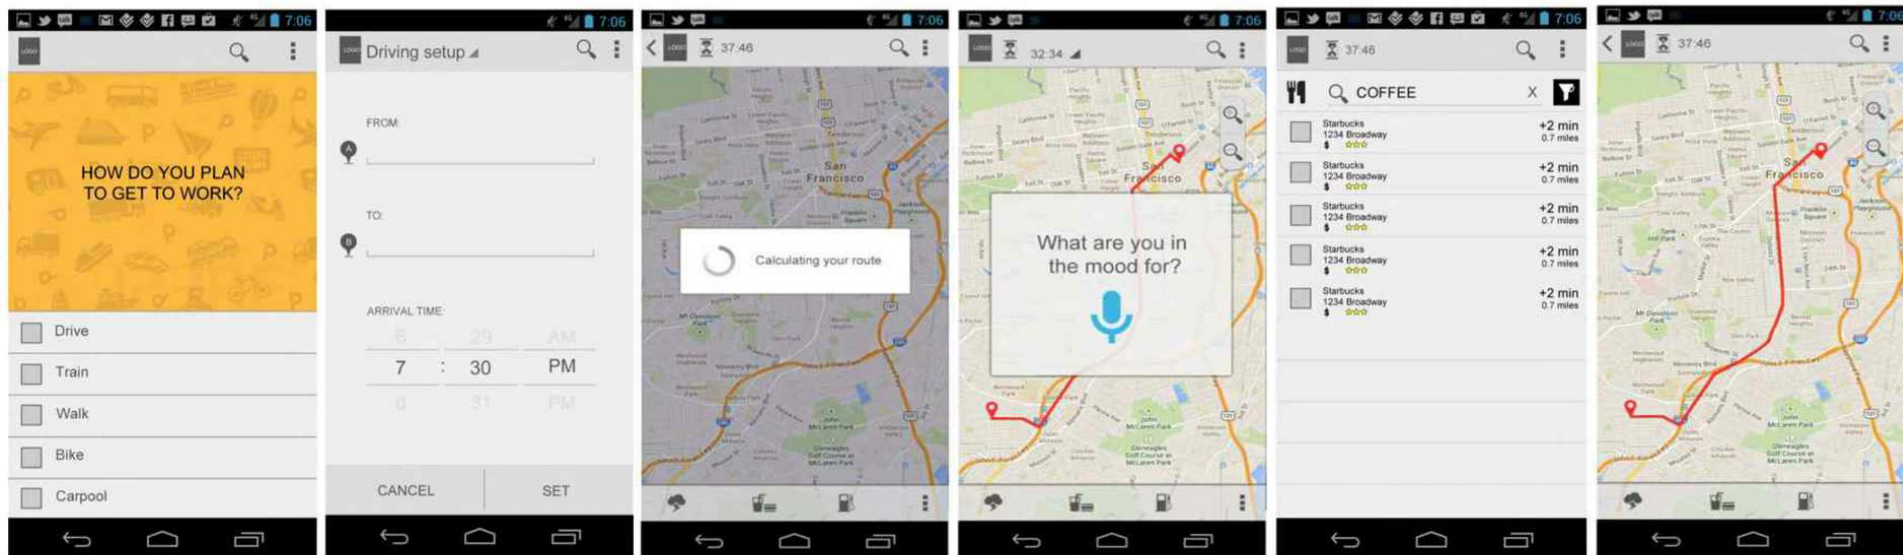

A **style tile / mood board** is a collage of tangible, visual design elements, like colour palette, font, or button style, which helps to communicate a concrete visual language with stakeholders

It is extremely useful to get design feedback during early phases

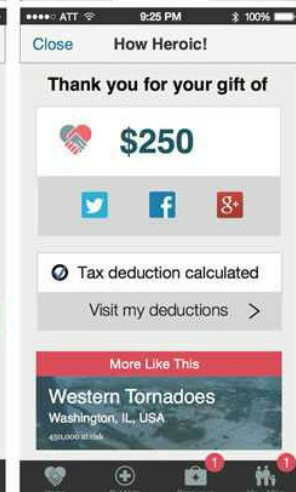

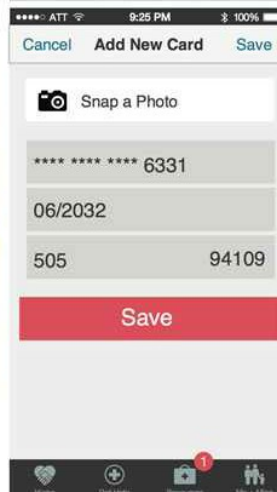

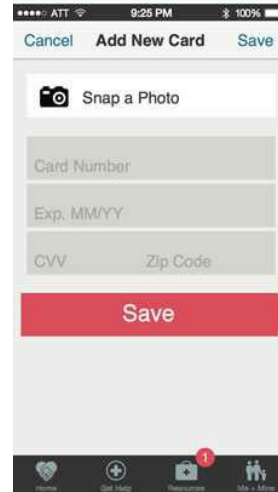

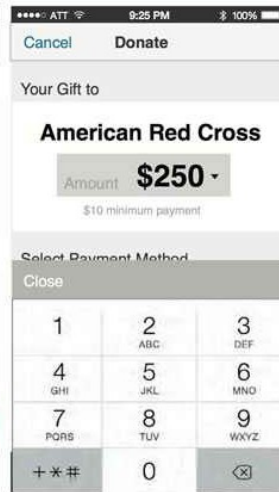

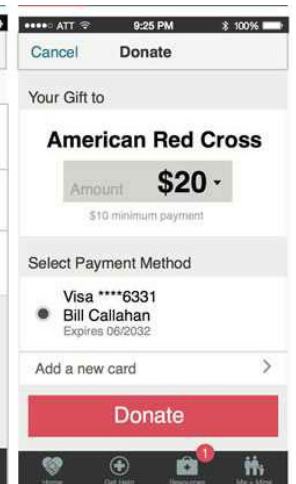

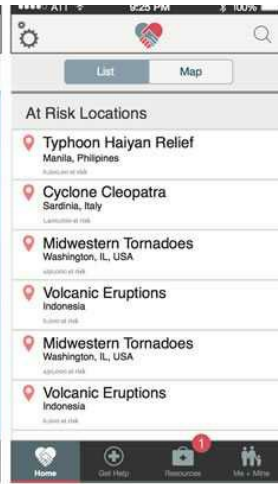

Welcome Screen

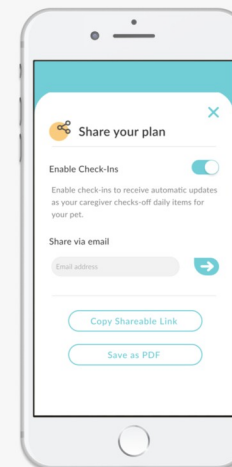

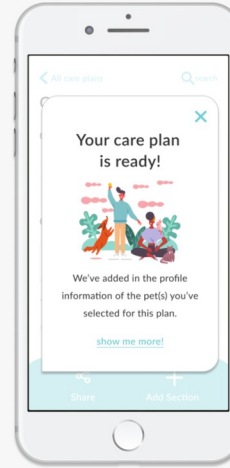

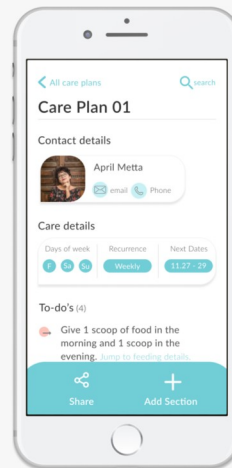

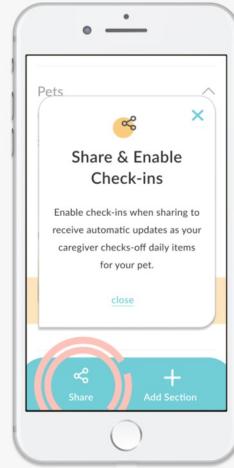

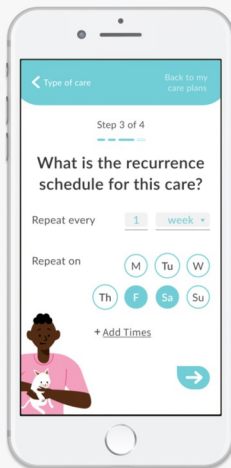

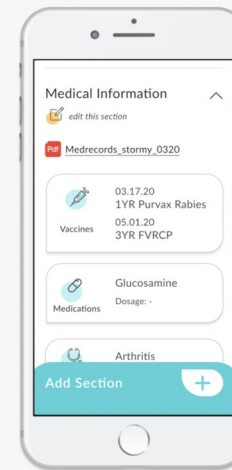

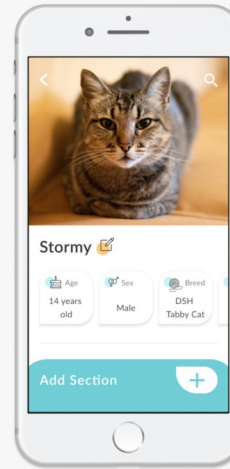

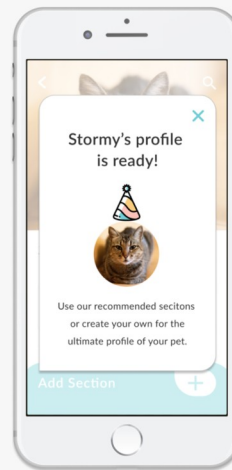

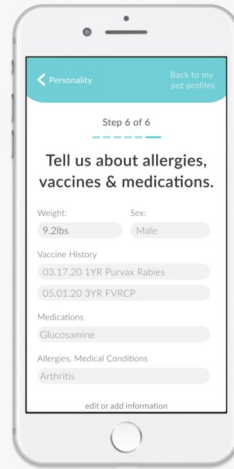

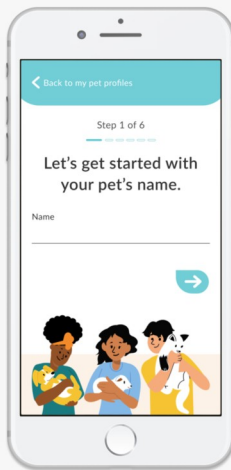

The drop down menu is an alternative to the home arrow to change mode of transportation.

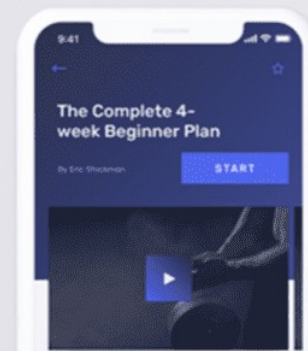

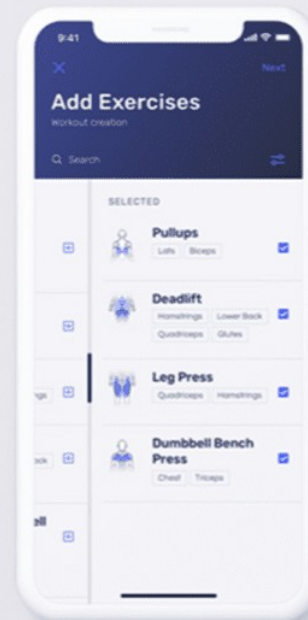

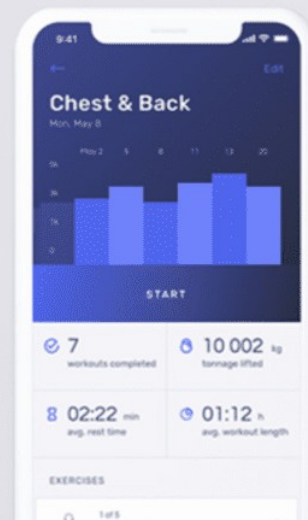

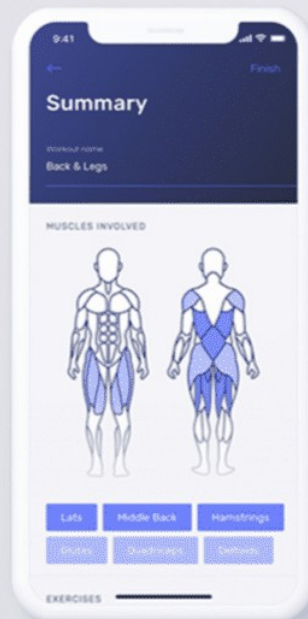

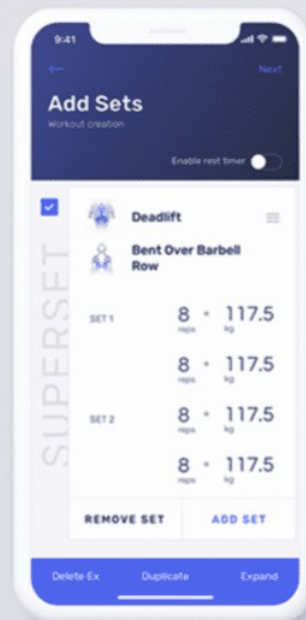

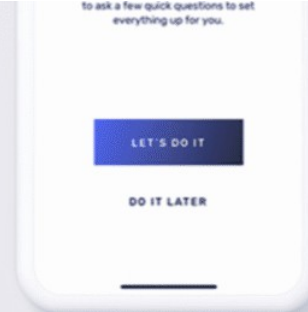

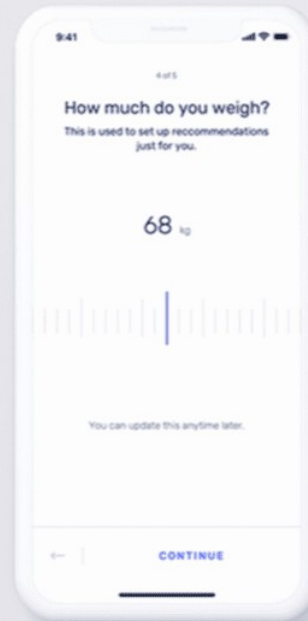

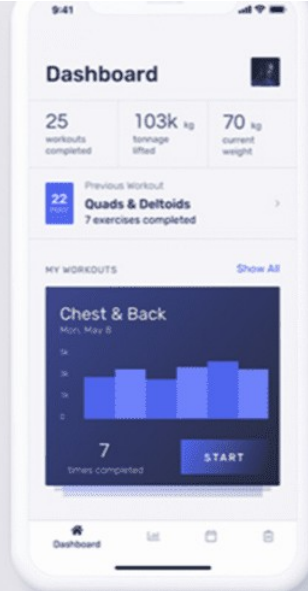

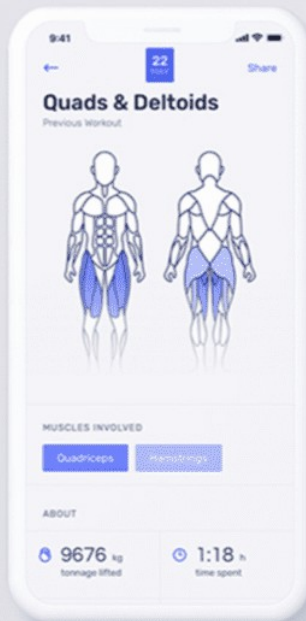

The user taps the food/drink icon and because they're driving, voice search is activated

A list of geographically relevant search results come up for the users's search "coffee"

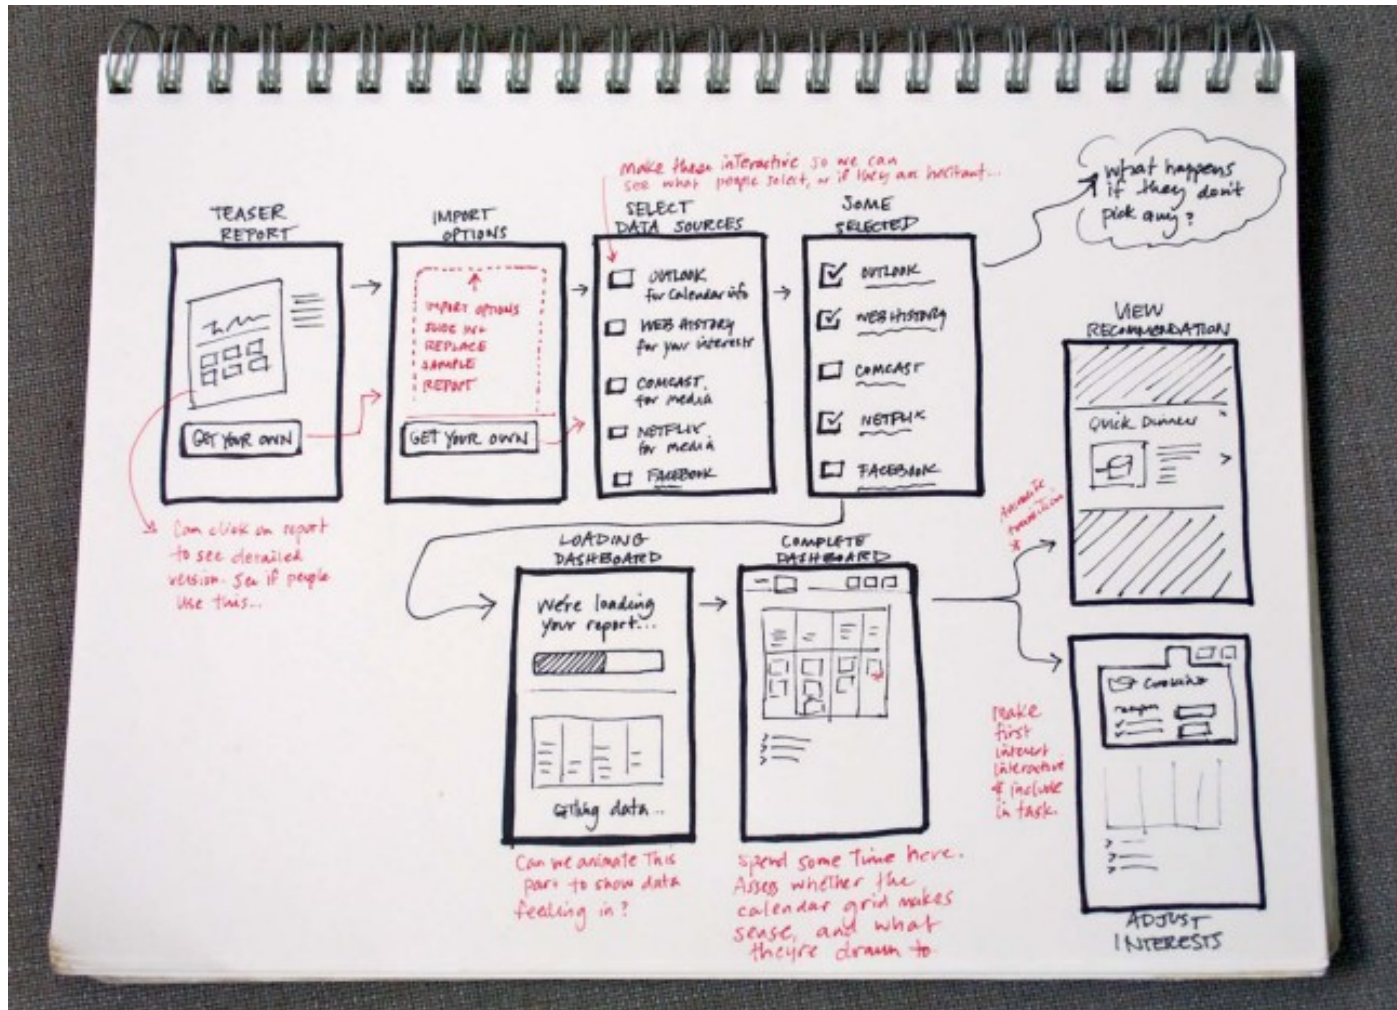

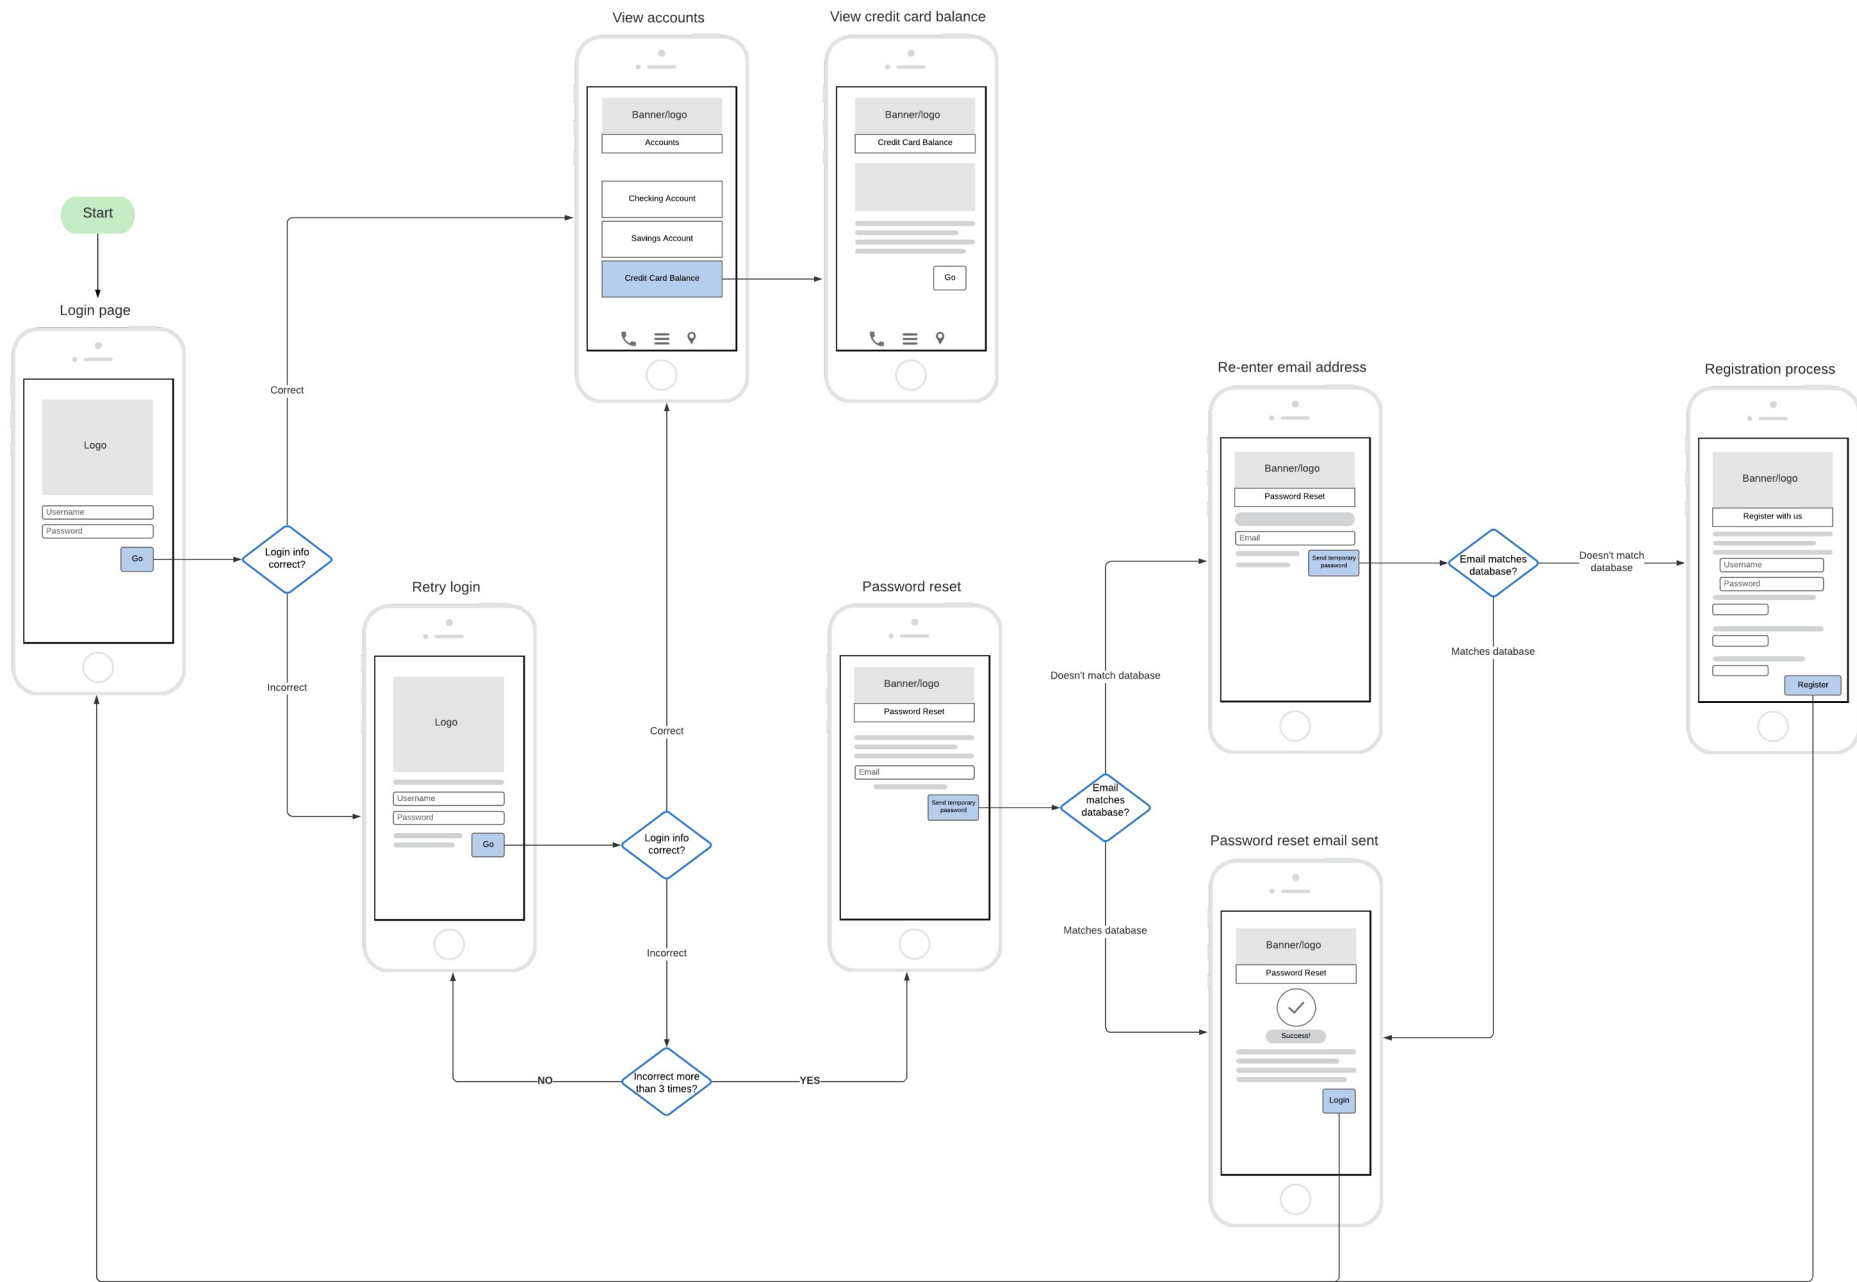

Task/user/interaction flows

- A **task (or user or interaction) flow** is a diagrammatic representation of the sequences of actions/screens that users will follow to complete tasks in your app
- Task flows are complementary to the prototypes you produce and are based on them
- A task flow gets you thinking about how people really use your product
 - What are the most likely scenarios and sequences that users will follow?
 - Are there potential side doors that users may use to end up in the same place?

- You can draw a task flow on paper or make it with diagramming software

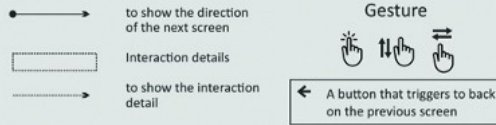

- Keep it lightweight
 - you can attach Post-it notes on large paper to plot out your task flow
 - add notes for how transitions should take place in the task flow and for other important points that are not self-evident from simply looking at the task flow
 - draw connector lines, annotations, etc. directly on the paper
- Don't boil the ocean
 - if the system is complex, do not create a massive task flow that encompasses an entire system
 - create discrete flows that focus on core scenarios
 - at the end, you can think about how individual task flows connect to each other

User only can borrow one item for 3 days

FAQs page

FAQ

1. How I can borrow an equipment?
answer:

2. Where I can take the equipment?
answer:

Task flow creation

- Figure out your starting point
 - Top-down approach: what should a user encounter first? what are the major parts of the product? what happens as the user works his way deeper into the product?
 - Bottom-up approach: start with the most interesting steps in the process and ask yourself what comes before and after them?
- Consider what comes next (or prior)
 - Think about how your users would get to the starting point, and where they would go next
 - Repeat this process, working your way from start to finish, or spreading out from the central moment you began with until you hit a reasonable start and end point

Persona: Sam

"My time is really precious. I like cutting-edge innovations that shave valuable seconds off of common tasks to help me be more productive and get stuff done."

Scenario: Planning ahead

Sam is coming back today at noon from a business trip to Phoenix. After landing at SFO Airport he needs to **meet up with a designer** before going home, to review design progress and provide input to the project. He knows the meeting was scheduled for that afternoon in San Francisco, but can't remember the exact **time and place**.

🕒 10:15 AM Tuesday, PST

✈️ Online at 30,000 feet

Ok, I need to see my schedule for upcoming events. I'll check my feed later.

Let's see what's in my calendar for today...

Great! It's gonna take me just 30 minutes to get there. I should be fine if the fly arrives on time and traffic on the 101 is not jammed.

Hmm, strange I didn't set a reminder. I wonder how far is this place from the airport.

I don't remember if we confirmed anything, so I'm gonna send Julio a message to let him know that I'll see him at 2pm.
