# Persistent vs transient navigation

- Because there is limited space on mobile screens, not everything can be visible in a mobile UI
- It's tempting to rely on transient navigation patterns in order to simplify mobile interface designs, especially on small screens
- But hiding critical parts of an application behind these kinds of solutions could negatively impact usage

# Hamburger Menus and Hidden Navigation Hurt UX Metrics

by **KARA PERNICE** and **RALUCA BUDIU** on June 26, 2016

Topics: [Design Patterns](#) [Mobile & Tablet](#) [Navigation](#)

**Summary:** Discoverability is cut almost in half by hiding a website's main navigation. Also, task time is longer and perceived task difficulty increases.

Our quantitative usability testing of hidden menus (such as hamburger icons) and visible menus (such as links across the top of pages) reveals that:

- **Hidden navigation is less discoverable** than visible or partially visible navigation.
  - When navigation is hidden, users are less likely to use navigation.
  - If people use hidden navigation, they do so later in the task than if it were visible.
- **Hidden navigation provides a worse user experience than visible** or partially visible navigation does, in both mobile phones and desktop user interfaces. This finding holds true across multiple UX metrics including users' assessment of task difficulty, time spent on task, and task success.
- On desktops, hiding navigation degrades the experience and the navigation discoverability more than it does on the phones.
- Hiding the navigation mostly affects content that is not directly accessible through an in-page link.

# The effects of platform navigation guidelines on the usability of smartphone applications

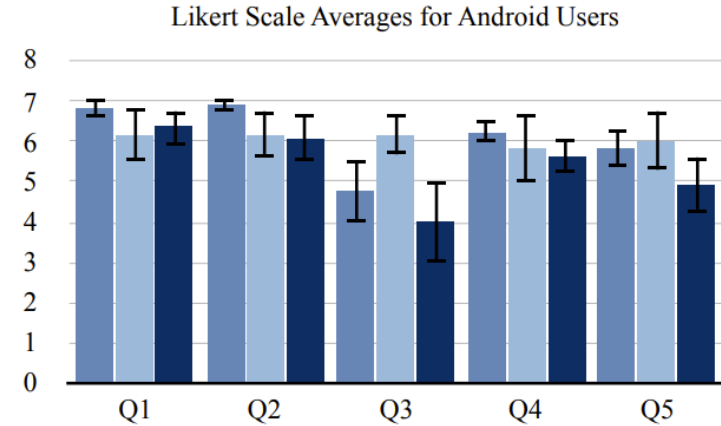

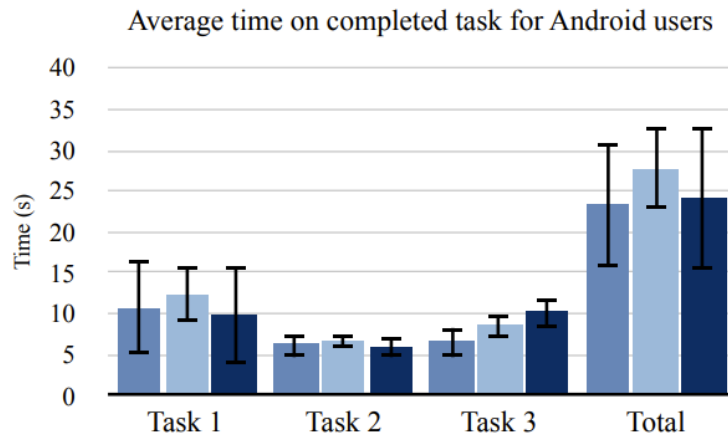

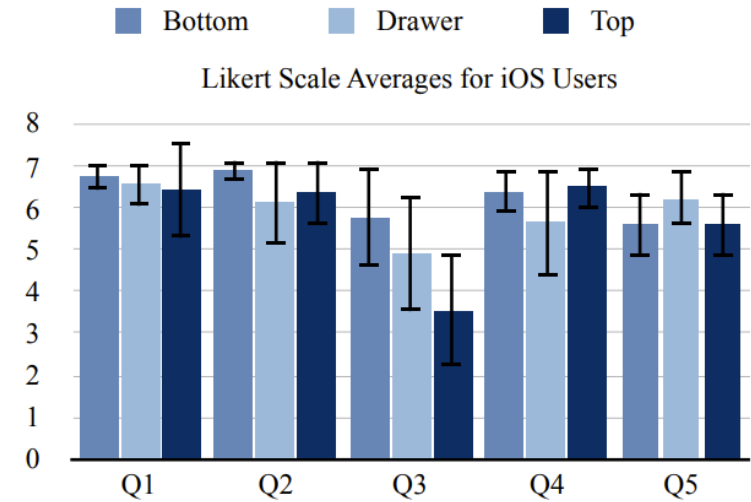

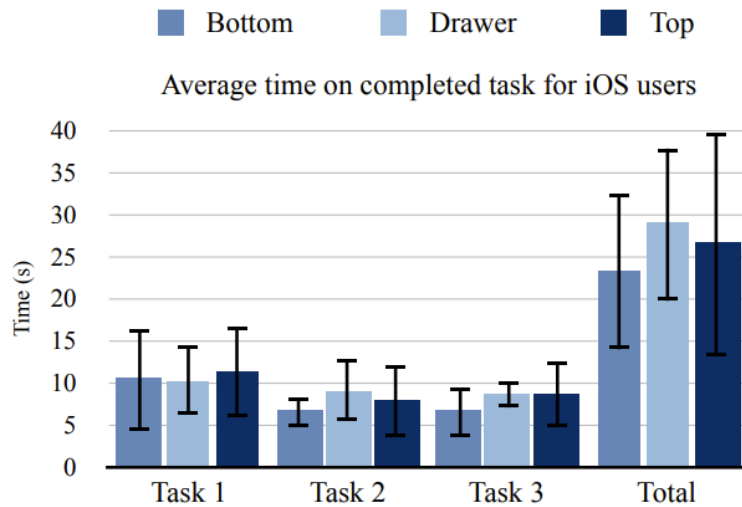

Josefine Martinsson

KTH Royal Institute of Technology

CSC School of Computer Science and Communication

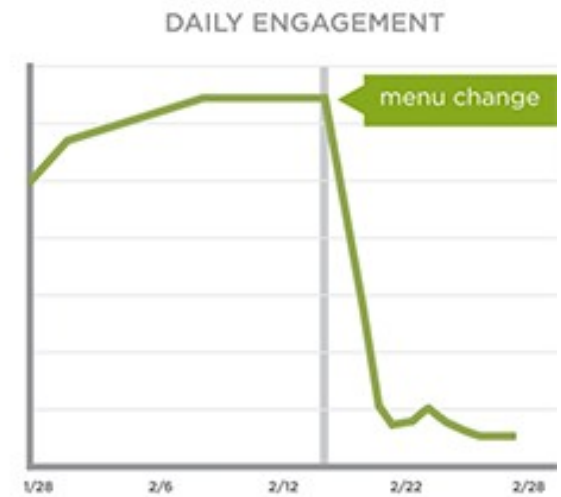

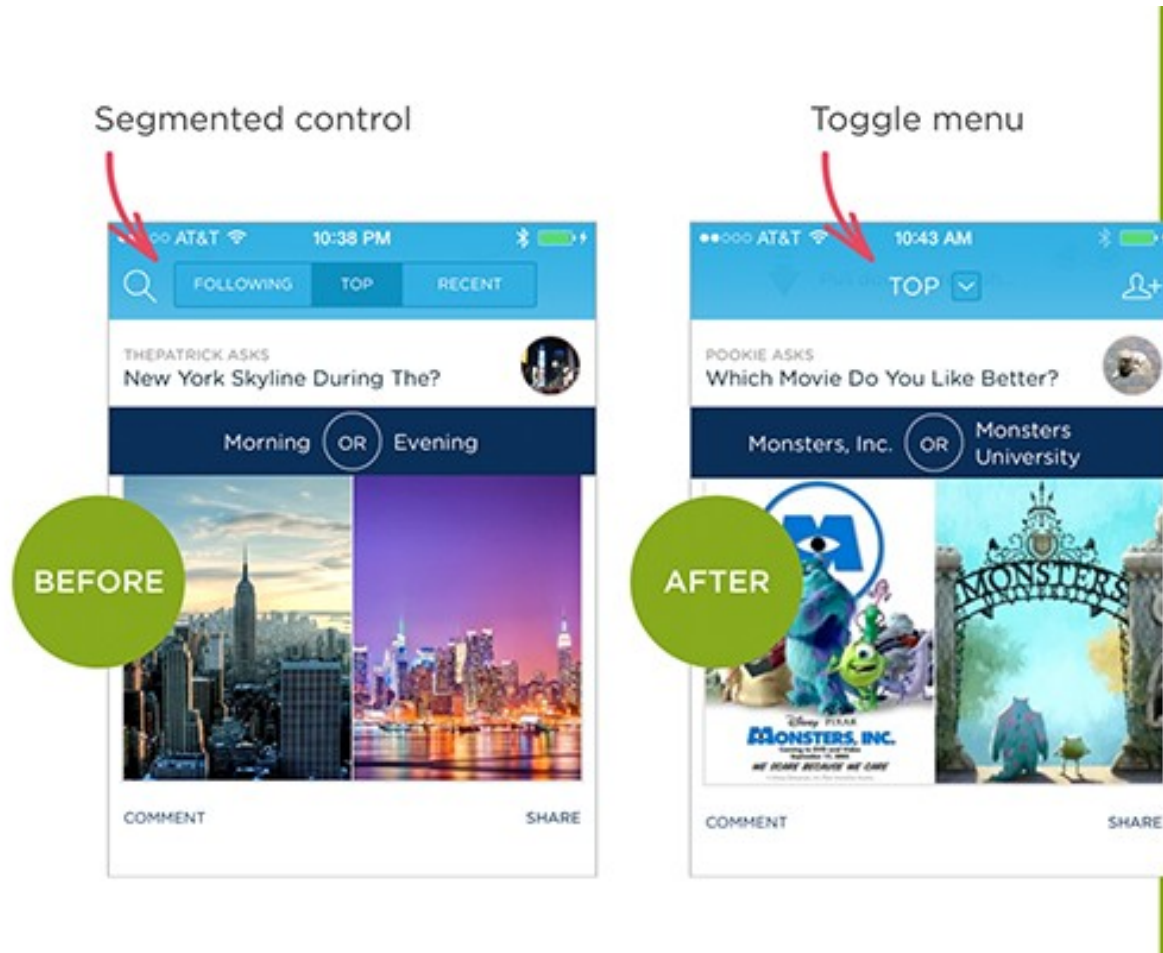

- Unpublished study comparing Bottom Bars, Side Drawer, and Tab Bar

Q1: It was easy to find the navigation Q2: It was easy to use the navigation  
 Q3: The navigation felt consistent with that used by other applications on my phone  
 Q4: The navigation made it easy to understand the architecture of the application  
 Q5: The navigation made it easy to understand what features were available in the application

# Persistent vs transient navigation

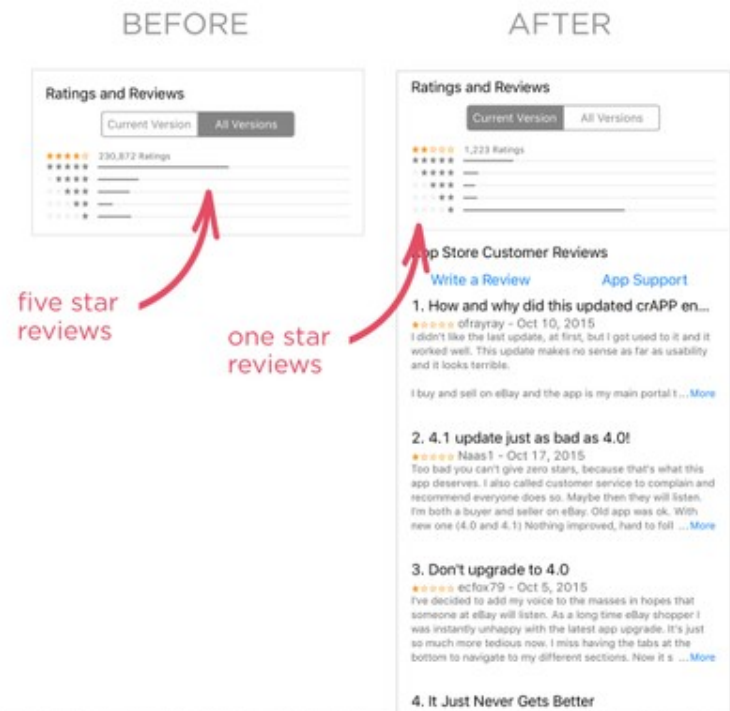

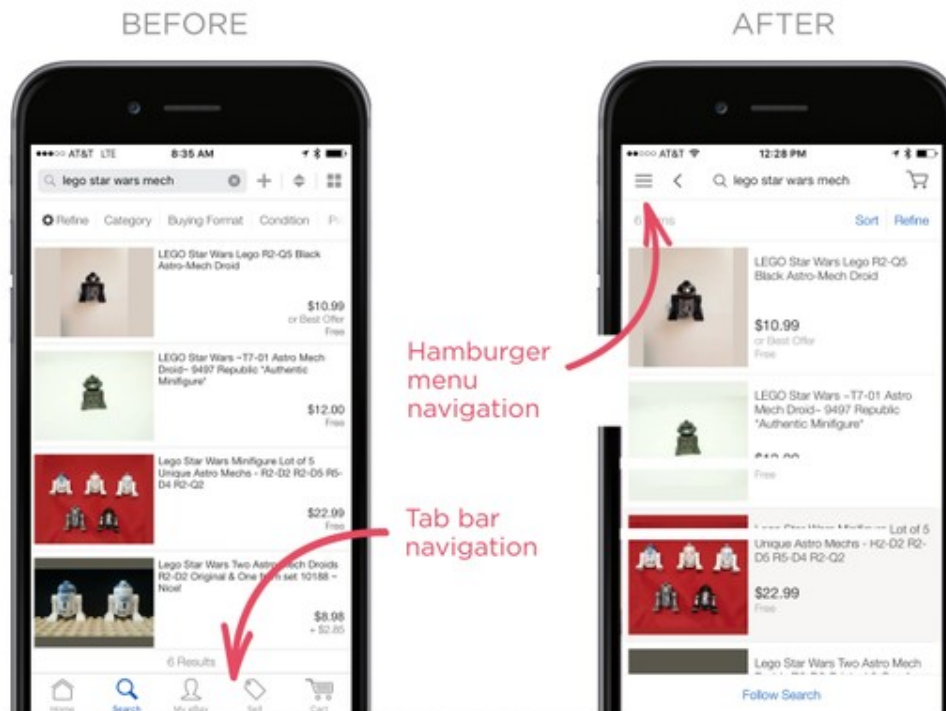

# Persistent vs transient navigation

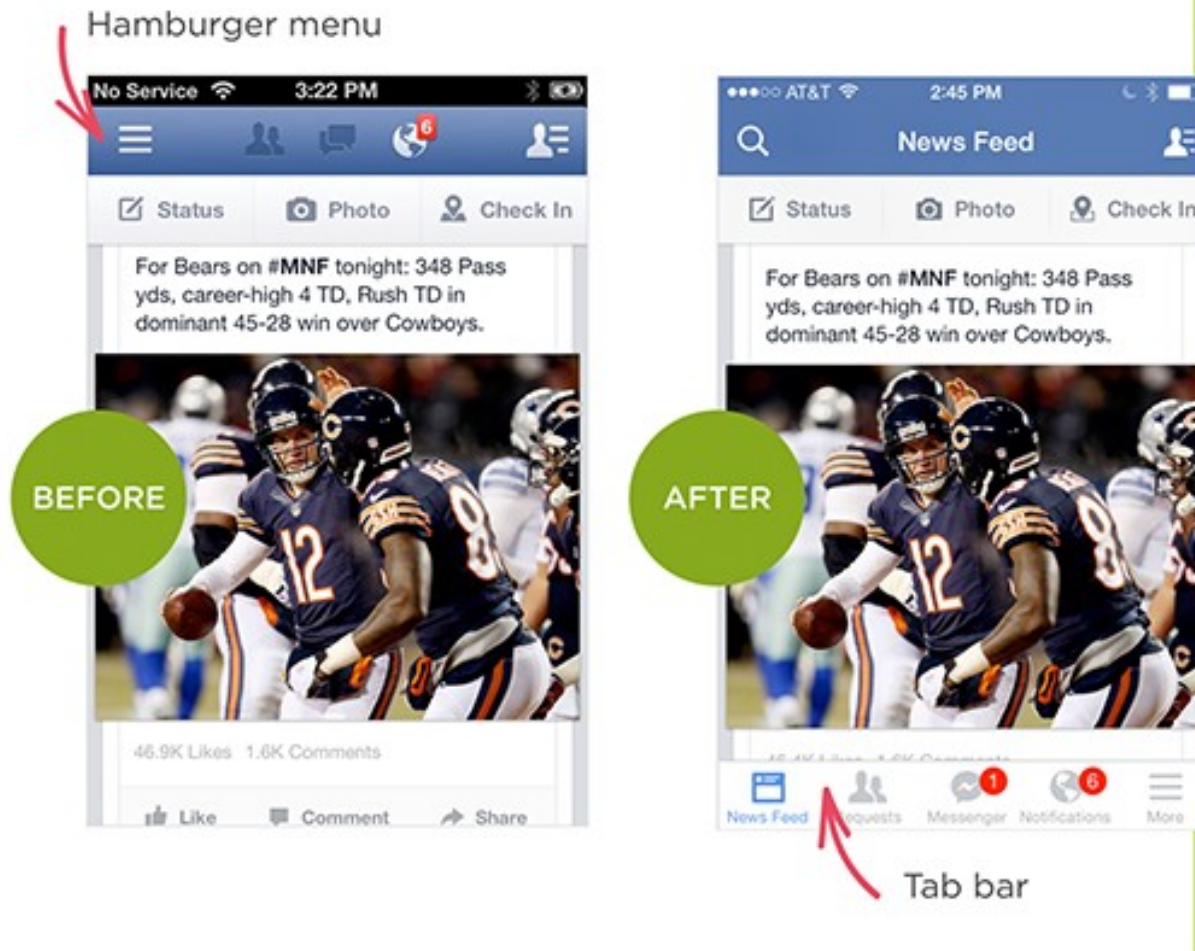

engagement time  
halved: weekly  
frequency & daily  
frequency down;  
time spent in app  
down.

# Persistent vs transient navigation

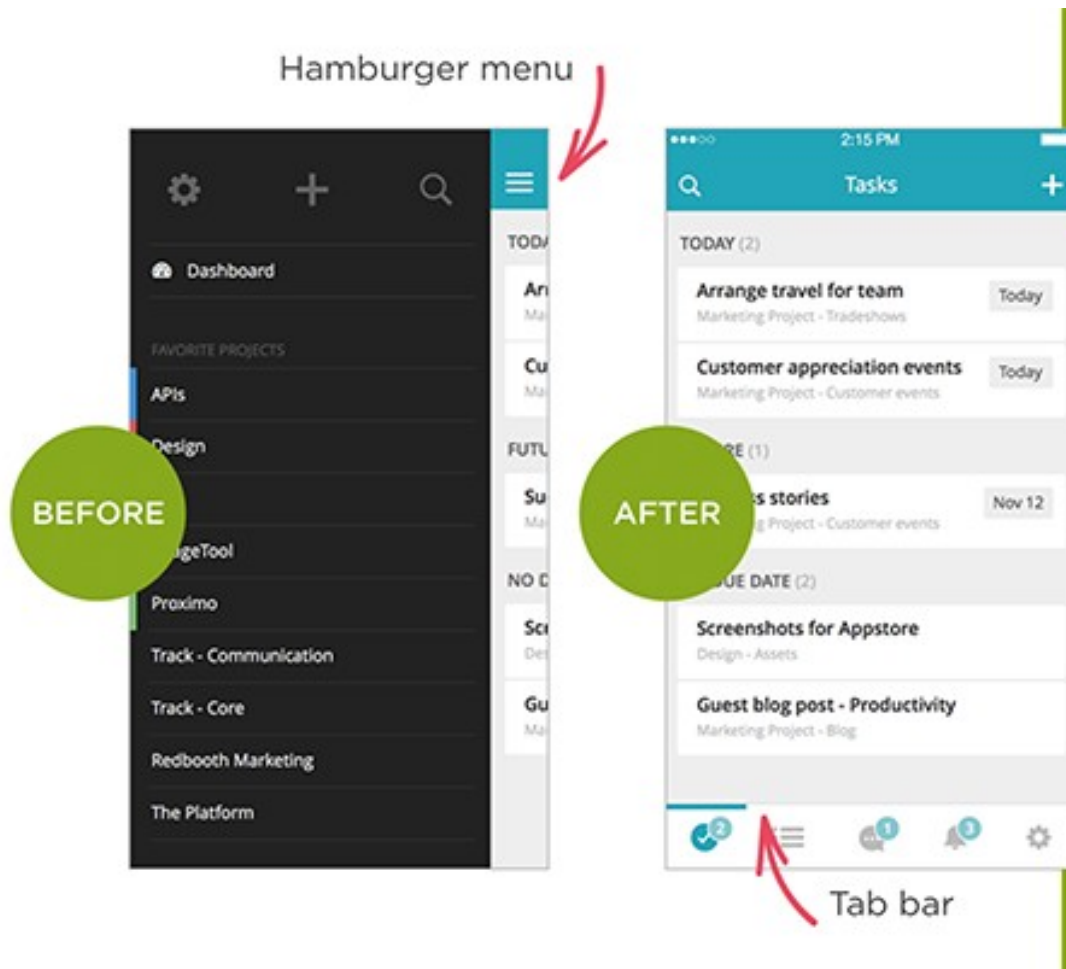

# Persistent vs transient navigation

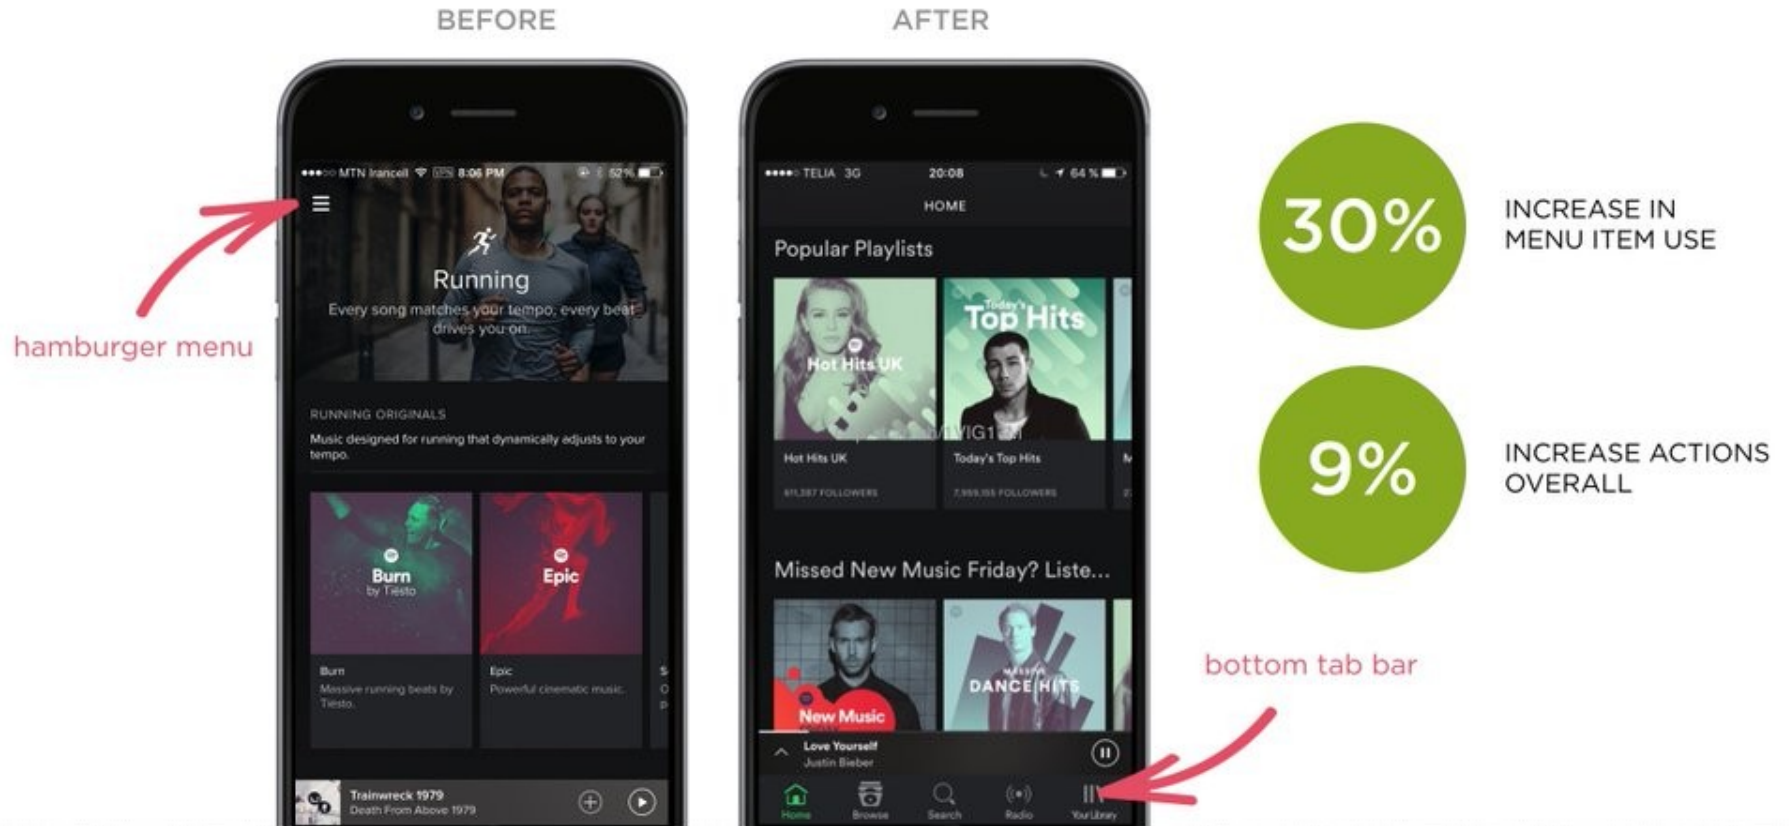

better on:  
engagement,  
satisfaction,  
revenue, speed &  
perception of speed  
metrics.

# Persistent vs transient navigation

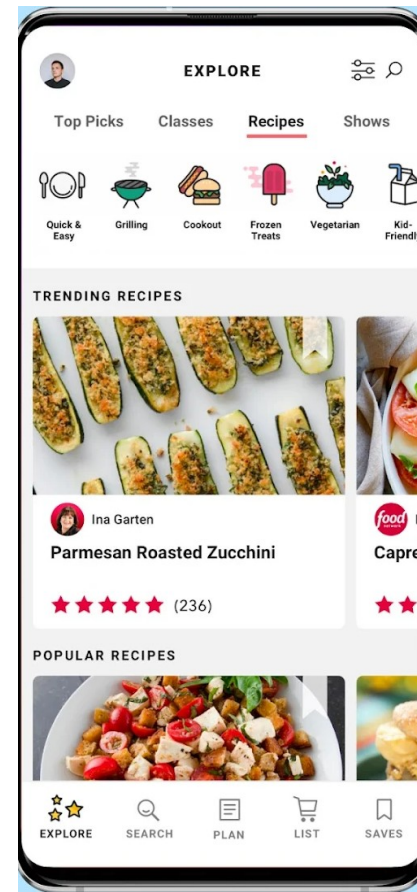

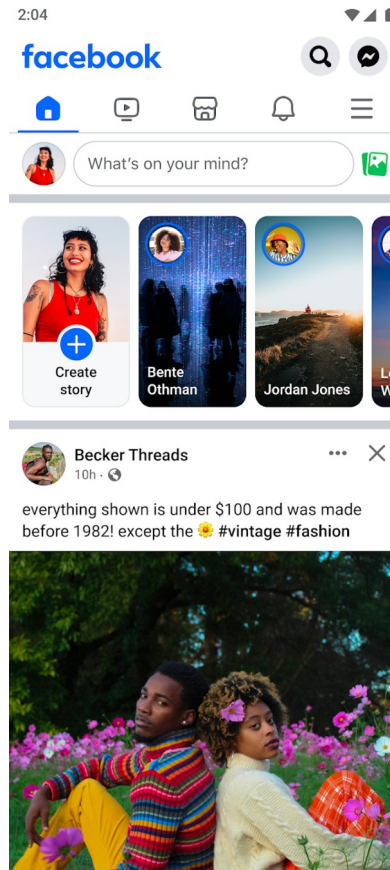

number of sessions more than doubled; session time increased 70%; 65% increase in daily active users.

# Persistent vs transient navigation

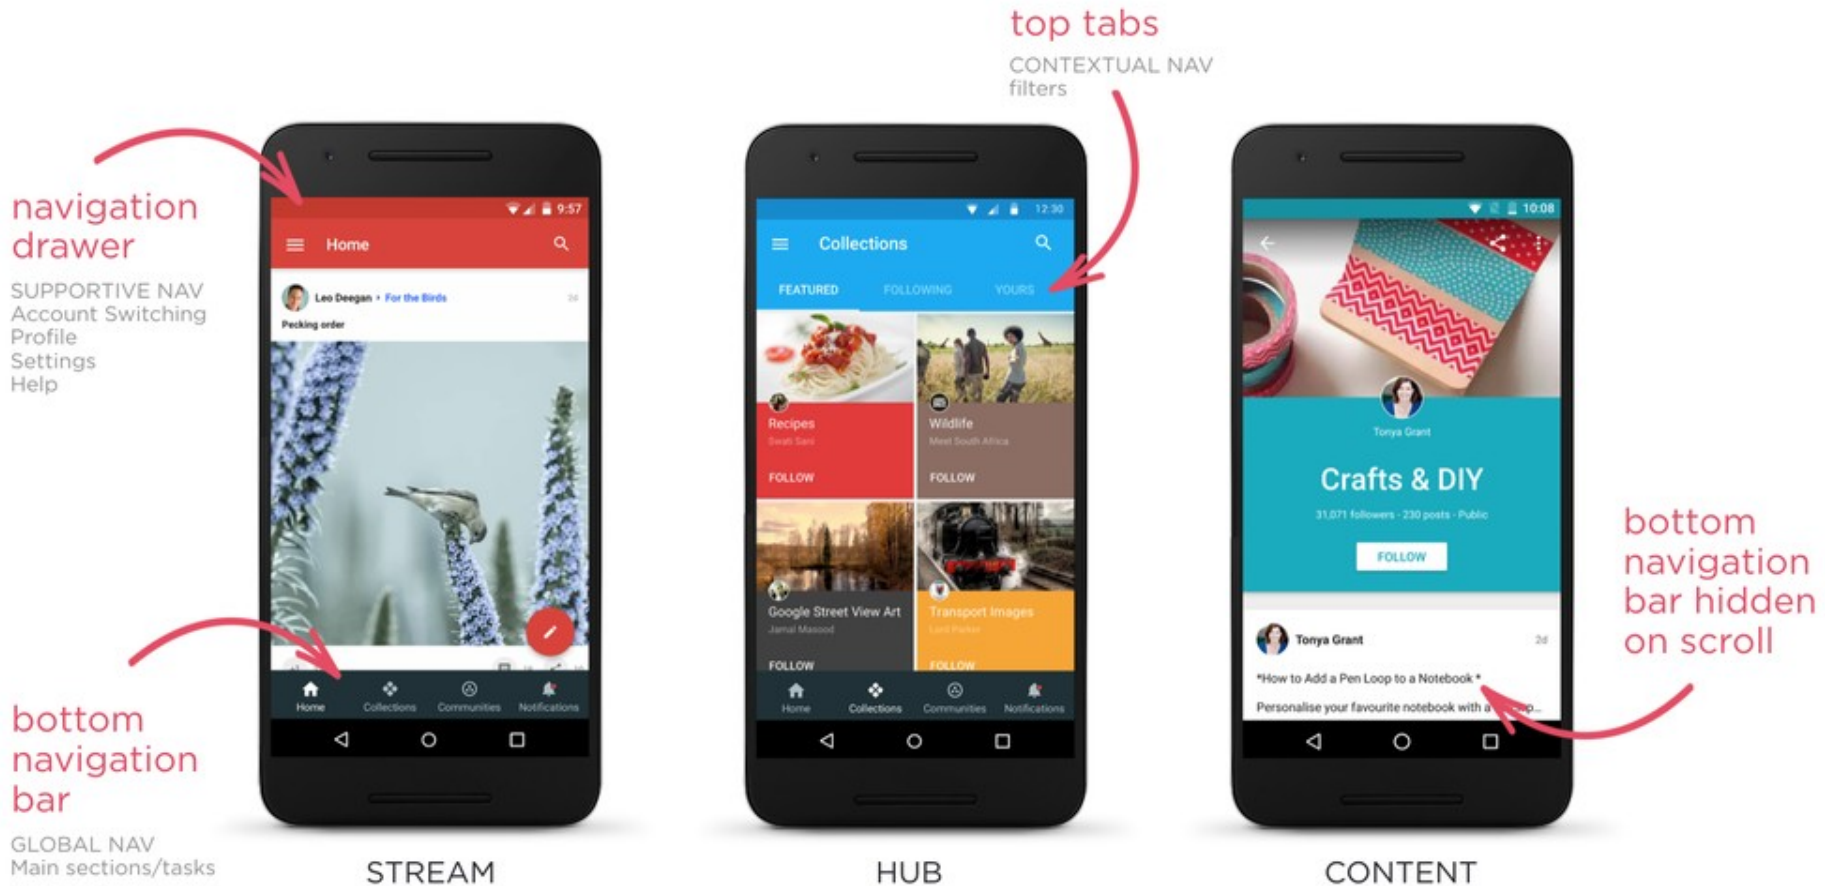

# Content over navigation

think about how you can start the conversation off with content rather than a list of navigation options

# Content over navigation

not all your screens need all your nav
